SECTION 11: TOXICOLOGICAL INFORMATION.

<u>Miscellaneous Toxicological Information:</u>	In a Xerox sponsored chronic inhalation study in rats using a special toner, there were no lung changes at all in the lowest exposure level (mg/cubic meter). This is the most relevant level to human exposures. A very slight degree of fibroses was noted in 25% of the animals at the mid exposure level (4mg/cubic meter). While a slight degree of fibrosis was observed at the highest exposure level (16 mg/cubic meter) in all animals. These findings are attributed to "Lung Overloading". (A generic response to excessive amounts of any dust retained in the lungs for a prolonged interval). The special test toner was ten times more respirable than commercially available toners to comply with EPA testing protocol and would not function properly in a copier or printer.
<u>Mutagenicity:</u>	No mutagenicity detected by Ames Test.
<u>Carcinogens:</u>	None present.
<u>Medical Conditions Aggravated by Exposure:</u>	None when used as described by product literature.
This material when used as intended does not represent a health or safety hazard.
